

NVConsult.eu — 2026 Website Project

DETAILED PROJECT INSTRUCTIONS, INPUTS, CHANGES & ACCEPTANCE REQUIREMENTS

1. Core Instruction — Rebuild Properly

The NVConsult.eu website must be redesigned/rebuilt as a clean, coherent system. Do not repeat the earlier approach of putting a new homepage beside old-looking internal pages or mixing legacy Trivisa UI with the new design.

- The final public website must use ONE consistent NVConsult design system across the homepage and every internal page.
- Old HTML/CSS/JS is a legacy/reference/migration source only. Do not copy the old Trivisa visual design back into the new public frontend.
- Preserve useful existing functionality and content/data where relevant, but rebuild the presentation and architecture cleanly.
- Do not leave dummy/test sections, placeholder content, broken CSS, unfinished components, or pages that fall back to the old UI.
- The package must be clear: public frontend, admin/CMS, API/backend, database, data/assets, legacy/reference files, and developer documentation should be separated logically.
- Do not claim the site is production-ready until code-level QA and deployment-level QA have actually been performed.

2. Business Purpose & Audience

- Primary audience: non-EU candidates outside Canada/EU and other destination markets.
- EU candidates remain welcome.
- The site is a hybrid of SEO/organic traffic, practical jobs/study/immigration utility, and consultation/service conversion.
- The core journeys are Work, Study, Immigration and Jobs. Explore is the discovery layer.
- The website should build trust through useful, current, people-first information rather than aggressive sales copy.
- Never guarantee immigration eligibility, visas, jobs, approval, PR, citizenship or outcomes.

3. Approved Visual / UX Direction

- Modern, clean, premium but approachable.
- Navy/blue brand identity.
- White/light content sections.
- Strong, professional typography.
- Generous spacing and clear hierarchy.
- Restrained rounded cards; avoid excessive card clutter.
- Clear, visible calls to action.
- Destination-led homepage.
- The Country Explorer/map is the signature homepage feature.
- Internal pages must feel like the same website as the homepage, not a different template.
- Do not use the old Trivisa visual language as the public design.
- Responsive/mobile-first behavior is required.

4. Main Navigation

Recommended top-level navigation:

- Explore
- Work
- Study
- Immigration — MUST remain a first-class top-level section.
- Jobs
- Visa News
- Guides
- Success Stories
- About
- Search
- Check My Options
- Consultation/booking CTA should remain accessible.

5. Country Explorer — Signature Feature / Interactive Map

This is a major requirement and must be implemented as a real interactive Country Explorer, not a decorative image or dummy map.

- Use an interactive Leaflet map.
- The map is driven by the central country data model.
- Include country search.
- Include Work / Study / Immigration / Jobs filters.
- Include region filters.
- Country markers must be interactive.
- Hover/click should expose a country preview or relevant country information.
- Include popular/featured destination cards below the map.
- The map should remain visually quiet and premium, not cluttered.
- Only approximately 5–7 major destinations should have prominent visible labels by default; other destinations should remain discoverable through search, filtering, hover or interaction.
- Mobile should use a simplified, usable map/explorer experience rather than trying to reproduce a dense desktop map.
- The same country data must power the map, country cards, country pages, comparison, Check My Options, jobs, news and guides.
- Do not expose technical GIS complexity to normal administrators.

6. Country Data Model

Each country should support at least:

- Name
- Slug
- Region
- Flag
- Image
- Description
- Work enabled
- Study enabled
- Immigration enabled
- Jobs enabled
- Featured
- Show in Country Explorer
- Status
- Internal map coordinates / map metadata handled by the system, not entered by ordinary admins

- Relationships to pathways, jobs, programs, news, guides and other relevant content

Initial curated destinations:

- Canada
- United States
- Australia
- New Zealand
- Japan
- United Kingdom
- Germany
- Czech Republic
- Netherlands
- Poland
- Austria
- Portugal

7. Admin Map Controls

- Admin control should be simple and unique: e.g. 'Show in Country Explorer'.
- Do NOT require the administrator to enter latitude/longitude or technical GIS settings.
- Coordinates and technical map behavior should be managed internally.
- Admin should be able to select which countries are visible/featured in the Explorer.

8. Country Pages

Every country page should be generated from the central country model and support:

- Country overview
- Work / work visas / work pathways
- Jobs
- Study / programs / scholarships
- Immigration / pathways / PR / family / citizenship where applicable
- Visa News
- Guides
- Success Stories
- Compare
- Check My Options
- Future-ready Cities section
- Related content and clear consultation CTA

9. Immigration Architecture

Immigration must be treated separately from Work and Study. It is not just a visa-information subsection.

- Skilled Immigration
- Permanent Residence
- Family Immigration
- Business / Investor
- Regional Programs
- Citizenship
- Use only categories that fit NVConsult's actual scope; do not manufacture programs.

Each immigration pathway should support:

- Overview
- Eligibility
- Job offer requirement
- Education
- Work experience
- Language
- Salary/income where relevant
- Documents
- Step-by-step process
- Cost
- Timeline
- Family options
- Long-term options
- Common mistakes
- Who is unsuitable / when the pathway may not fit
- Official sources
- Last verified date
- Related jobs
- Related guides
- Related Visa News
- Consultation CTA

10. Visa News

Visa News must be a distinct content type from evergreen Guides.

- Focus on what actually changed and who is affected.
- Use official/primary sources wherever possible.
- AI may assist with discovery or drafting, but human verification is required before publication.
- Every item should support: What changed; Who is affected; What has not changed; What to do; NVConsult analysis; official sources; published date; last verified; country; pathway; category; related content.
- Do not present stale information as current.
- Clearly distinguish news/current policy from evergreen explanatory content.

11. Guides

Guides should be evergreen, people-first and practical.

- Direct answer
- Requirements
- Process
- Costs
- Timeline
- Common mistakes
- Who may be unsuitable
- Official sources
- Related content
- Consultation CTA
- Author/reviewer
- Last verified date

12. Jobs System

Preserve the useful existing job-search functionality, but integrate it into the new design system.

- Job title
- Company
- Country
- City
- Region
- Sector
- Occupation
- Salary
- Currency
- Experience
- Education
- Language
- Sponsorship status
- Visa pathway
- Source
- Original URL
- Posted date
- Expiry date
- Status
- Featured
- Verified
- Last checked

Sponsorship status values should support:

- Confirmed
- Likely / possible
- Work permit support
- EU Blue Card eligible
- Not specified
- No sponsorship
- Expired jobs must not appear as current jobs.

13. Study System

- Study destinations
- Universities / institutions
- Programs
- Scholarships
- Study pathways
- Related country information
- Related guides/news
- Clear enquiry/consultation CTAs
- Admin-controlled content rather than hardcoded page text

14. Check My Options

Create an interactive options assessment that provides directional guidance, not a legal/immigration guarantee.

- Nationality

- Age range
- Education
- Occupation
- Work experience
- Language
- Goal
- Preferred destinations
- Budget
- Family situation where relevant

Result levels:

- Strong potential
- Worth investigating
- Possible but challenging
- Likely unsuitable
- Show reasons behind the result.
- Do not guarantee eligibility.
- Questions, scoring/rules and destination/pathway relationships should be CMS-controlled where practical.

15. Country Comparison

- Allow comparison of 2–4 countries.
- Use factual, transparent attributes.
- Avoid arbitrary star ratings unless a clear methodology exists.
- Comparison should use the same central country data as the Explorer and country pages.

16. Dynamic Collections

Support automatic, manual and hybrid collections.

- Automatic
- Manual
- Hybrid

Example collection concepts:

- Healthcare Abroad
- International Nurses
- Jobs With Visa Sponsorship
- Skilled Workers
- Study in Europe
- Canada Immigration
- EU Blue Card
- English-Speaking Jobs
- Manual pinning should be able to override automatic sorting.

17. Content Types

- Guide
- Visa News
- Job
- Study Program

- Success Story
- Country
- Pathway
- Landing Page
- Standard Page

18. Taxonomies

- Country
- Region
- Category
- Goal
- Pathway
- Occupation
- Sector
- Language
- Audience
- Content must be able to have multiple relevant taxonomy terms.

19. CMS / Admin Requirements

The admin system must be genuinely useful, not a visual mockup.

- Admin can add/edit/delete/publish/unpublish posts.
- Admin can add/edit categories.
- Admin can add/edit pages.
- Admin can add/edit countries.
- Admin can add/edit pathways.
- Admin can manage jobs.
- Admin can manage study programs.
- Admin can manage collections.
- Admin can manage options-assessment rules/questions.
- Admin can manage media.
- Admin can manage site settings.
- Admin can manage navigation.
- Admin can manage social links.
- Admin can manage booking configuration.
- Admin can control SEO fields.
- Admin can control reusable sections/components.
- Admin should not be forced to edit source code for normal content operations.

20. Page Builder / Sections

Use a controlled section-based page builder rather than unrestricted pixel-level design.

- Add section
- Remove section
- Hide/show section
- Reorder section
- Duplicate section
- Edit section
- Reuse existing section

- Create/save section templates

Reusable component types:

- Hero
- Rich Text
- Image
- Two Columns
- Stats
- Country Cards
- Job Cards
- Visa News Cards
- Guide Cards
- Pathway Cards
- Study Program Cards
- Success Stories
- FAQ
- Accordion
- Timeline
- Comparison
- CTA
- Newsletter
- Video
- Collection
- System complexity belongs in the implementation; the admin interface should stay understandable.

21. Page Templates

- Country
- Pathway
- Guide
- Visa News
- Job
- Study Program
- Custom Landing Page
- Standard Page

22. Success Stories

- Use substantiated/permissioned stories where required.
- Do not invent testimonials, placement counts or outcomes.
- Include relevant context while protecting personal information.
- Connect stories to destinations/pathways/services where appropriate.

23. Social Media

The site should have a social-media section and sharing support.

- Facebook profile
- Instagram profile
- LinkedIn profile
- X profile

- YouTube profile
- TikTok profile
- WhatsApp
- Custom social/profile links

Sharing:

- LinkedIn
- Facebook
- X
- WhatsApp

True automatic publishing to social networks requires official OAuth/API integrations and real credentials. Credentials must remain server-side and must never be placed in frontend JavaScript.

24. Booking / Consultation

- Keep the existing Cal.com booking functionality.
- Centralize booking configuration instead of scattering booking URLs through individual pages.
- Support provider / free-paid / embed / enabled settings as appropriate.
- Booking CTA should be available throughout relevant conversion journeys.
- Do not invent or hardcode a new booking provider.

25. SEO

- SEO title
- Meta description
- Slug
- Canonical URL
- Open Graph title
- Open Graph description
- Open Graph image
- Schema/structured data
- Index/noindex
- Breadcrumbs
- Related content
- Author/reviewer
- Updated / verified information

Structured data should support relevant types such as:

- Organization
- WebSite
- BreadcrumbList
- Article
- NewsArticle
- JobPosting
- Other valid schema types appropriate to the content

26. Analytics Events

- country_view
- pathway_view

- job_search
- job_view
- news_view
- guide_view
- comparison_started
- options_check_started
- options_check_completed
- consultation_clicked
- booking_started
- booking_completed
- pricing_view
- newsletter_signup

27. Trust & Claims

- Existing claims such as 1K+ guided, 500+ placements, 15+ countries and 4.8 Trustpilot must be verified before being used as factual marketing claims.
- Define what each metric means if retained.
- Do not invent replacement metrics.
- Do not fabricate Trustpilot or other third-party ratings.

28. Security

- Server-side authentication
- Password hashing
- Secure sessions
- CSRF protection
- Input validation
- Output escaping
- Upload validation
- Role-based permissions
- Rate limiting
- Audit log
- Backups and rollback strategy
- No secrets/credentials in frontend JS.
- The old exposed AI API credential must be revoked/rotated and must not be reused.

29. Admin Roles

- Super Admin
- Editor
- Jobs Manager
- SEO Manager
- Reviewer

30. Developer Extension / Future-Proofing

The architecture must allow future developers to extend the system without rebuilding the entire site.

- Add new content types
- Add new components
- Add API routes

- Add social providers
- Add map layers
- Add collection rules
- Add analytics events
- Add AI workflows
- Add future city explorer
- Add salary/cost-of-living features
- Add job importers
- Add accounts/dashboard
- Add multilingual support
- Use clear modules/interfaces and documentation so future developers can work safely.

31. Existing Site — Preserve Useful Functionality, Not Old UI

The original site contains useful reference functionality that should be preserved/reimplemented where appropriate:

- Job filtering, pagination, job cards/detail and JobPosting structured data.
- Country data merging/base country logic.
- Visa/pathway content relationships.
- Blog/content functionality.
- CV Maker/CV Studio functionality.
- Newsletter/contact functionality.
- PWA-related assets where still useful.
- Cal.com booking integration.

Legacy template baggage such as office.html and the old Trivisa visual system should not determine the new public design.

32. CV Maker

- Retain the useful existing CV Maker/CV Studio functionality.
- Integrate it into the new site design instead of allowing it to visually break the new system.
- Preserve the existing CV-related functionality/assets where technically appropriate.

33. Data & Content Rules

- Do not mix old dummy/test data with current production content.
- Do not label stale data as current.
- No fake jobs, fake visa news, fake universities, fake success stories or fake statistics.
- Current immigration/news information must be verified before publication.
- Where official sources are required, store/link the source clearly.
- Centralize data so the same country/pathway/job/program record can be reused across the site.

34. Hosting / Deployment

- Target hosting: Hostinger File Manager.
- Database: MySQL.
- Use a staging environment first.
- Back up the existing site before deployment.
- Configure production secrets securely.
- Enable/verify SSL.
- Run functional tests before replacing the live site.

- Deployment instructions must be written for a developer/admin who will use Hostinger.
- A local/code-level QA pass is not the same as live Hostinger QA; both should be distinguished.

35. Package Structure Requirement

The final deliverable should be a clear package with separated responsibilities, for example:

- public/ — clean public frontend
- admin/ — admin/CMS
- api/ — backend endpoints
- lib/ — reusable backend/system logic
- database/ — schema and seed/migration files
- public/data/ — structured content/configuration where applicable
- public/assets/ — CSS, JS, images and other assets
- legacy/ — original/reference site, not intended for deployment
- docs/ — developer guide, setup and extension documentation
- README / project instructions
- Do not mix legacy UI files into the active public frontend.

36. Required QA Before Calling the Package Complete

- All public pages load.
- All pages use the same new design system.
- No page silently displays the old Trivisa UI.
- No missing CSS/JS/image paths.
- No obvious placeholder/dummy sections.
- Navigation links work.
- Country Explorer loads and interacts correctly.
- Country search/filter/map behavior works.
- Country pages connect to the same country records.
- Jobs filtering/detail pages work.
- News/guides/pathways work.
- Check My Options works.
- Comparison works.
- Admin forms/routes work at code level.
- Authentication/security controls are not client-only.
- Booking configuration works.
- Newsletter/contact flows work.
- CV Maker works.
- Responsive behavior is checked.
- SEO metadata/schema is checked.
- Expired jobs are excluded.
- No frontend API secrets.
- PHP syntax and basic application integrity are checked.
- Broken internal links and asset references are checked.
- Deployment-specific configuration is documented.

Important: passing local/code tests does not prove that the Hostinger deployment works. Live deployment testing must be performed separately.

37. Explicit Feedback That Must Not Be Repeated

- The homepage was previously mostly dummy and the CSS looked wrong.
- Other pages previously did not match the homepage and still showed the older UI.
- Repeatedly patching the old site produced mixed/inconsistent results.
- The project therefore moved to a clean rebuild from scratch.
- The final implementation must not return to the same patching approach.
- The user explicitly requested that the build be fully implemented without missing components.
- The user explicitly requested that data and implementation be kept clear and not mixed together.
- The user requested a step back and a proper redesign/rebuild rather than another incomplete iteration.

38. Acceptance Standard

The final result should feel like one intentionally designed NVConsult.eu product from the first page to the last. A clean homepage alone is not sufficient. Every internal page, data model, admin workflow and signature feature must be integrated into the same system.

- Consistency over isolated page polish.
- Real functionality over visual placeholders.
- Centralized data over hardcoded duplicates.
- Simple admin controls over technical configuration.
- Extensible architecture over one-off hacks.
- Verified content over invented claims.
- Secure server-side behavior over client-side shortcuts.
- Clear separation of active code, data, documentation and legacy/reference files.

39. Current Reference Assets / Project Inputs

- Original website ZIP: nvslon_public_html.zip
- Original site contains the Travisa HTML Codex template plus NVConsult functionality.
- Original useful assets/data should be inspected and selectively migrated.
- The old admin.js used browser localStorage for several data stores and a hardcoded client-side password; this is not acceptable for the new CMS.
- The old chatbot.js contained an exposed external AI API key; it must not be reused.
- Existing Cal.com booking integration should be retained through a centralized configuration.
- Original image assets should be reused where they fit the new design, without forcing the old visual style.

40. Final Developer Instruction

Treat this document as the consolidated source of truth for the NVConsult.eu website redesign. Before changing architecture or removing a feature, verify whether it is listed here or exists in the original site as useful functionality. Do not solve a visual problem by reintroducing the legacy template. Do not solve a missing-feature problem with a dummy placeholder. Implement the feature properly or clearly document what remains unimplemented. Keep the package organized, testable, extensible and deployable on the stated Hostinger/MySQL environment.
